

# TANG FRAGMENT OF A KNIFE HR-6246 - TIN BRONZE - LATE BRONZE AGE - SWITZERLAND

<b>Artefact name</b>	Tang fragment of a knife HR-6246
<b>Authors</b>	Marianne. Senn (EMPA, Dübendorf, Zurich, Switzerland) & Christian. Degryny (HE-Arc CR, Neuchâtel, Neuchâtel, Switzerland)
<b>Url</b>	/artefacts/322/

## ∨ The object

## ∨ Description and visual observation

<b>Description of the artefact</b>	Tang fragment with lake (shiny brown) and terrestrial (granulated green-blue) crust (Fig. 1). Dimensions: L = 2.7cm; Ø = around 5mm; WT = 5.8g.
<b>Type of artefact</b>	Knife
<b>Origin</b>	Hauterive - Champréveyres, Neuchâtel, Neuchâtel, Switzerland
<b>Recovering date</b>	Excavation 1983-1985, object from layer 1 (layer with material from Bronze Age till 20th cent.)
<b>Chronology category</b>	Late Bronze Age
<b>chronology tpq</b>	<input type="text" value="1050"/> B.C. ▾
<b>chronology taq</b>	<input type="text" value="800"/> B.C. ▾
<b>Chronology comment</b>	Hallstatt A/B (1050BC _ 800BC)
<b>Burial conditions / environment</b>	Lake
<b>Artefact location</b>	Laténium, Neuchâtel, Neuchâtel
<b>Owner</b>	Laténium, Neuchâtel, Neuchâtel
<b>Inv. number</b>	Hr 6246
<b>Recorded conservation data</b>	Not conserved

## Complementary information

Nothing to report.

Study area(s)

Fig. 3: Micrograph of the cross-section showing the location of Figs. 5 to 11,

Description of sample

The cross-section corresponds to a lateral cut (Fig. 2). The surface is covered with a thick corrosion crust (Fig. 3).

Alloy

Tin Bronze

Technology

Cold worked after annealing

Lab number of sample

MAH 87-197

Sample location

Musées d'art et d'histoire, Genève, Geneva

Responsible institution

Musées d'art et d'histoire, Genève, Geneva

**Date and aim of sampling**

1987, metallography and corrosion characterisation

**Complementary information**

Nothing to report.

**Analyses and results****Analyses performed:**

Metallography (etched with ferric chloride reagent), Vickers hardness testing, ICP-OES, SEM/EDS, XRD.

**Non invasive analysis****Metal**

The remaining metal is a tin bronze (Table 1) with high porosity and large cracks both on the left and right edges of the sample (Fig. 3). The metal contains small, elongated copper sulphide (Table 2) and Pb inclusions that are oriented parallel to the cracks. Near the metal surface, slip lines are outlined by the development of intergranular corrosion (Fig. 5). The etched metal shows small, elongated grains with slip lines (Fig. 6). Annealing is visible in areas near the surface. The average hardness of the metal is HV1 145, but significant variations are observed, depending on where the measurements are taken.

Elements	Cu	Sn	Sb	Ni	Pb	As	Ag	Co	Fe	Zn
mass%	89.85	8.02	0.60	0.55	0.34	0.34	0.18	0.10	0.02	0.01

<b>Microstructure</b>	Elongated grains + strain lines with pores
<b>First metal element</b>	Cu
<b>Other metal elements</b>	Sn

#### Complementary information

Nothing to report.

#### Corrosion layers

The corrosion crust has a thickness between 0.1mm and 0.7mm (Fig. 3). In bright field (Fig. 7), one can observe that the metal has been replaced by light-grey corrosion products. Adjacent to the metal is a thick, heterogeneous, dark-grey layer with a band of light-grey corrosion products. In polarised light (Fig. 8), all corrosion products which were previously light-grey appear brown-orange, the dark-grey layer turquoise. The elemental chemical distribution of the SEM images (Figs. 9 and 10) reveals that the inner corrosion products are Sn-rich whereas the adjacent band is Cu and S-rich (Fig. 11). The outer layer contains large inclusions (quartz and others, Si, Al and Na, see Figs. 10-11) and is most probably composed of malachite/ $\text{Cu}_2(\text{CO}_3)(\text{OH})_2$  (only Cu and O are detected – Fig. 11). S is distributed throughout this layer. XRD analyses indicated the presence of posnjakite/ $\text{Cu}_4\text{SO}_4(\text{OH})_6\text{H}_2\text{O}$ , chalcocite/ $\text{Cu}_2\text{S}$  and djurleite/ $\text{Cu}_3\text{S}_2$  (Schweizer 1994).

**Corrosion form** Uniform - transgranular  
**Corrosion type** Type I (Robbiola)

**Complementary information**

Nothing to report.

∨ MiCorr stratigraphy(ies) – CS

Fig. 4: Stratigraphic representation of the object in cross-section using the MiCorr application. This representation can be compared to Fig. 8.

∨ Synthesis of the binocular / cross-section examination of the corrosion structure

Corrected stratigraphic representation: none.

## ∨ Conclusion

The tang fragment is made from a leaded bronze and has been cold worked on the top surface after annealing. The SEM/EDX examination and past XRD analyses indicate the presence of chalcopyrite in the corrosion crust, typical of lake context (Schweizer 1994), enriched with Sn close to the metal surface and depleted of Cu on the outer surface. This object was certainly abandoned rather quickly in an anaerobic, humid and S and Fe-rich environment, favouring then the formation of chalcopyrite. The limit of the original surface most probably lies between the Sn-rich inner layer and the Fe and S-rich outer layers. The presence of iron oxides on top of the copper corrosion crust has not yet been explained. The corrosion is a type 1 according Robbiola et al. 1998.
