Fig. 1: Photograph of the aeroplane showing the location of the fixation plate (red dot) (www.hepta.aero),

Description and visual observation

Description of the artefact	Fixation plate for the wooden construction, broken by use (Fig. 1).
Type of artefact	Aeroplane part
Origin	Dufaux IV aeroplane
Recovering date	Biplane built by Henri and Armand Dufaux in 1909/10
Chronology category	Modern Times
chronology tpq	1909 A.D.
chronology taq	1910 A.D.
Chronology comment	1909 _ 1910
Burial conditions / environment	Outdoor to indoor atmosphere
Artefact location	Swiss Museum of Transport, Luzern, Lucerne
Owner	Swiss Museum of Transport, Luzern, Lucerne
Inv. number	VHS-497 (2)
Recorded conservation data	Not known

Complementary information

Nothing to report.

Fig. 3: Micrograph of the cross-section showing the location of Figs. 5 to 9,

Description of sample	The top part has been cut during sampling (Fig. 2). The more regular right side is the plate surface and the irregular side is the broken edge (Fig. 3). Dimensions: L = 4mm ; W = 4mm.
Alloy	Al Cu Sn Zn Si Alloy
Technology	As-cast
Lab number of sample	DUF-4
Sample location	Empa (Marianne Senn)
Responsible institution	Swiss Museum of Transport, Luzern, Lucerne
Date and aim of sampling	September 2007, metallography and alloy composition

Complementary information

Nothing to report.

Analyses and results

Analyses performed:
Metallography (unetched), Vickers hardness testing, SEM/EDS.

Non invasive analysis

Metal

The metal is an aluminium alloy containing Cu, Sn, Zn and Si (Table 1). The unetched metal shows an as-cast structure consisting of the aluminium matrix with Sn (not soluble in Al) inclusions (Figs. 5 and 6), intermetallic compounds such as Al_2Cu (Fig. 5, red arrows) and clusters of Al,Fe,Cu & Si phases (Fig. 5, black arrows). There are porosities in the metal (Figs. 3 and 5). The average hardness of the metal is HV1 80.

Elements	Al	Cu	Sn	Zn	Si	Fe	O	Fe	Total
Metal (average)	89	4.6	3	1.6	1	<	0.8	<	100
Intermetallic compounds	45	55	<	<	<	<	<	<	100
Al,Fe,Si,Cu phase clusters	58	11	<	<	7.5	29	3.4	29	109
Sn inclusions	<	<	100	<	<	<	<	<	100

Table 1: Chemical composition (mass %) of the metal and inclusions (from Fig. 5). Method of analysis: SEM/EDS, Laboratory of Analytical Chemistry, Empa.

Fig. 5: Micrograph of the metal sample from Fig. 3 (detail), unetched, bright field. The cast structure is revealed by light grey intermetallic compounds (Al2Cu, red arrows), dark-grey Al,Fe,Si & Cu phase clusters (black arrows) and Sn inclusions (nodules). On the top left some pores can be seen,

Fig. 6: SEM image of the metal sample from Fig. 3 (detail), SE-mode, unetched. We observe in dark-grey the metal matrix, in medium-grey the intermetallic compound Al2Cu as well as Al,Fe,Si & Cu phase clusters and in light-grey the Sn inclusions,

Microstructure	Dendritic structure with inclusions
First metal element	Al
Other metal elements	Si, Cu, Zn, Sn

Complementary information

Nothing to report.

Corrosion layers

No corrosion layer can be seen on the metal surface (Figs. 3 and 7). Under polarized light small white and brown particles are visible on the broken edge (D1, Fig. 8). Their analysis reveals the presence of silica particles surrounded by dirt (Table 2 and Fig. 9). The metal surface is covered by a thin oxygen bearing skin (CP1, Fig. 9).

Elements	O	Al	Si	Cu	Total
Adherent particle (average of 3 similar analyses)	55	0.6	50	1.1	106

Table 2: Chemical composition (mass %) of the adhering particles to the metal surface (from Fig. 7). Method of analysis: SEM/EDS, Laboratory of Analytical Chemistry, Empa.

MiCorr stratigraphy(ies) – CS

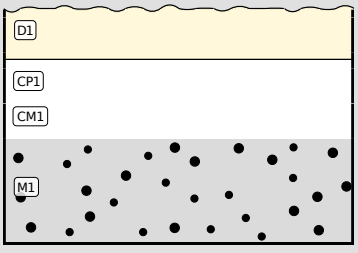

Fig. 4: Stratigraphic representation of the object in cross-section using the MiCorr application. This representation can be compared to Fig. 8, Credit HE-Arc CR.

Synthesis of the binocular / cross-section examination of the corrosion structure

Corrected stratigraphic representation: none.

Conclusion

Although not common at the beginning of the 20th, this Al-Cu-Sn-Zn-Si cast alloy was extensively used on the Dufaux IV plane. No corrosion layer has been found on the metal surface except adherent silica-rich particles and the thin oxidised skin typical of Al alloys. The presence of these materials might be explained by the regular maintenance of the metal using abrasive silicon carbide paper.
